### Technical Note

BGS Infiltration SuDS mapping has been produced to indicate which areas are likely to have ground conditions which are compatible with the use of infiltration SuDS and where there might be significant constraints. This mapping should be used for strategic purposes only and is not considered to be a replacement for a soakaway test or a site investigation in determining site-specific ground conditions. It should also be noted that whilst the mapping may show that an area is unlikely to be suitable for infiltration SuDS, other types of SuDS should still be considered. For example, features can be lined to prevent infiltration to the ground.

The Infiltration SuDS summary map is split into four sets of mapping: infiltration constraints, drainage summary, ground stability summary and groundwater protection summary. This map shows the infiltration constraints summary layer which indicates whether there is significant potential for any of the following hazards: soluble rock hazards, landslide hazards, shallow mining hazards (non-coal), made ground or persistently shallow groundwater. This map should be considered alongside the other map sets.
